Green Challenge: Day 12

I chose to research endangered sea otters. I've learned that they are essential for the ocean's biome in maintaining the balance of nearshore ecosystems like kelp forests, embayments and estuaries. Since sea otters are carnivores they feed off of many different fishes including sea urchins, which can be bad because they consume kelp forests. To survive they need a water habitat which can be either cold or warm, materials to construct dens for themselves and food such as fish. Sea otters are actually very adaptable animals; they have long whiskers to detect vibrations and claws to hunt. Currently humans are the biggest impediment for the sea otter population. Three things we can do is simply be more environmentally sustainable by recycling, using less water and by purchasing sustainable products.
